

Approved UI/UX handoff

Draught Bet · Android player application

The original client-approved visual direction is preserved unchanged and mapped to production behaviour, server-authoritative states and implementation controls.

15

approved boards

176

visible frames

160

implementation states

10

UX flows

Source of truth and resolved decisions

1 · Visual authority

The approved boards define composition, palette, typography, component treatment and interaction tone. The later regenerated artwork is excluded. Do not copy obsolete literal strings such as blockchain wording.

2 · Behavioural authority

The 160-state manifest defines routes, events, endpoints, failure handling and server/client ownership. It does not replace the approved appearance.

3 · Platform

Flutter targets Android. Phone chrome visible in concept boards is not an iOS implementation requirement; use Android system insets and SafeArea.

4 · Money

Fees, limits, balances, quotes, payout amounts and settlement status are server-provided. The client never treats a callback as proof of payment.

5 · Gameplay

The server owns legal moves, clocks, result and match version. During reconnect, moves remain disabled until the authoritative snapshot is applied.

6 · Assets

Logo, icons and illustrations still require source exports. Do not crop production assets from contact sheets.

| 02 → 03 provider return | 05 → 08 mismatch |
| 02 → 08 cancel/fail | 06 → 07 commit |
| 03 → 09 await webhook | 09 → 04 webhook arrives |
| 04 → 05 verified | 09 → 07 already credited |

NON-NEGOTIABLE INVARIANT

A provider return or client callback never credits the wallet; only a verified, idempotent server confirmation can.

Withdrawal quote, reservation, risk review and payout

Withdrawal quote, reservation, risk review and payout

FLOW-06 • Production UX state map

PRIMARY / ENTRY STATES

CONTINUATION / EXCEPTION STATES

AUTHORITATIVE TRANSITIONS

- | | |
|---------------------------|---------------------------|
| 01 → 02 eligible | 06 → 09 rejected |
| 02 → 03 verified | 07 → 08 provider confirms |
| 03 → 04 destination valid | 07 → 09 provider fails |
| 04 → 05 submit | 07 → 10 timeout |
| 05 → 06 reserved | 10 → 08 later success |
| 06 → 07 approved | 10 → 09 later failure |

NON-NEGOTIABLE INVARIANT

Concurrent withdrawal requests cannot reserve more than the available balance; ambiguous outcomes remain pending.

Identity verification and retry lifecycle

Identity verification and retry lifecycle

Implementation and release gate

- ☐ Match every coded screen against its approved visual board and shared tokens.
- ☐ Map every mutation to an authoritative response and prevent duplicate submissions.
- ☐ Run concurrent tests for stake locks, withdrawals, refunds and settlement.
- ☐ Disable gameplay during reconnect until the server snapshot and version are applied.
- ☐ Show payment success only after verified provider confirmation and ledger credit.
- ☐ Support Android system insets, text scaling, TalkBack and 44dp minimum targets.
- ☐ Obtain original logo, illustration and icon assets; do not crop screenshots.
- ☐ Complete legal, KYC, provider and safer-play review before production release.
